

# HPV Vaccine Protects Against SIX Types of Cancer

## Mouth and throat cancers

No screening test exists. The first symptom is often a lump in the neck. Ask your dentist to look for any signs of these cancers.

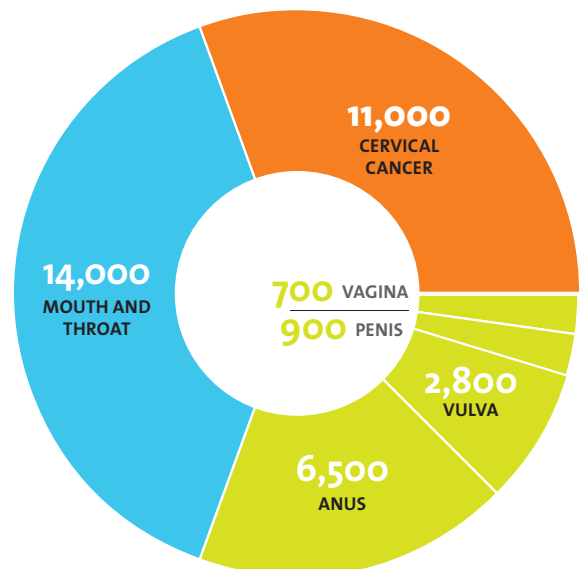

## Cervical cancer

Cervical cancer is the only type of cancer caused by HPV that can be detected early by a screening test.

## FOUR other cancers are caused by HPV

These cancers can't be detected early through a screening test. They are often found at a late state causing very serious problems or death.

ESTIMATED U.S. CASES EVERY YEAR <sup>1,2</sup>

HPV vaccine is a safe and effective vaccine that could prevent **over 90%** of these cancers.

CDC recommends the HPV vaccine for ALL teens starting at age 11 or 12. It can be given starting at age 9 and up to age 45.
