

HPV Vaccine Protects Against SIX Types of Cancer

Mouth and throat cancers

No screening test exists. The first symptom is often a lump in the neck. Ask your dentist to look for any signs of these cancers.

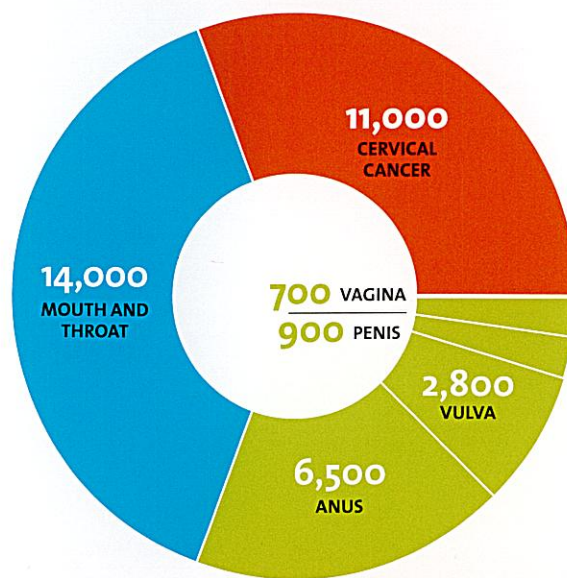

Cervical cancer

Cervical cancer is the only type of cancer caused by HPV that can be detected early by a screening test.

FOUR other cancers are caused by HPV

These cancers can't be detected early through a screening test. They are often found at a late state causing very serious problems or death.

ESTIMATED U.S. CASES EVERY YEAR ^{1,2}

HPV vaccine is a safe and effective vaccine that could prevent **over 90%** of these cancers.

CDC recommends the HPV vaccine for ALL teens starting at age 11 or 12. It can be given starting at age 9 and up to age 45.
